INSTRUCTIONS TO AUTHORS

**Aims and Scope:**

The Tikrit Journal of Pure Science (Tikrit. J.Sci) is a biannual refereed periodical devoted to the publication of articles that conform to its scope and editorial standards. The scope encompasses various disciplines of experimental and theoretical original studies in pure and applied sciences. The Journal publishes original research articles, review articles, short communications, case studies, and letters to the editor. Abstracts of meetings and symposia will also be considered for publication. All submitted papers are subjects to an extensive peer review by a panel of referees.

**Submission**

Contributions should be sent to the Executive Editor: Chief Editor

*College University of Tikrit-Iraq, E.mail : tik\_jsci@yahoo.co.uk*

The original manuscript and two copies should be submitted. The manuscript should be written in a good English or Arabic language. Submitted papers will be referees and, if necessary, authors may be asked to revise their manuscripts.

By submitting a paper for publication in Tikrit Journal of pure science the authors state explicitly that the paper has not been published nor has been submitted totally or partially for publication elsewhere, the author has no right to withdraw his article while it is under processing unless he presents a written paper to do so and has to pay for refereeing expenses.

**Time Schedule**

The main author should receive acknowledgement of receipt of the manuscript and within few months, he should have a notification of acceptance or rejection or a request for revising.

**Reprints:**

One reprint will be supplied to the principal author free of charge.

**Copyright Transfer:**

Upon publishing an article, its copyright is transferred automatically to the publisher without Further notification to the author.

**Manuscript preparation**

In preparation of the manuscript, the following instructions should be strictly followed:

**1-Manuscript:** the original manuscript should be typed on one side of A4 paper (210mm.X.297mm). Double-spaced with a 35mm Margin. Authors should be numbered. Authors are requested to use SI Units as the primary listing and to include, in parentheses, other conventional units only when their Listing is extremely necessary to improve immediate understanding of the article contents. Authors are asked after acceptance of their paper, to send the manuscript on a disc indicating the software used.

**2-Layout:** Authors are requested to adhere to the following order:

Title authors(s), Affiliations, Abstract, Keywords, Main text (1-Introduction 2-Experimental 3-results and Discussion, 4-Aknowledgments, 5-Appendices, 6-References, Figures, Legends and Tables.

**3.Length:** The total length of the paper should not exceed 10 printed pages of the Journal.

**4.Title:** The title should be concise and brief.

**5. Abstract:** The abstract should not exceed 200 words. It should contain the key words of the papers as well as the essence of the results achieved.

**6. Figures:** Each Figure must be referred to in the text, and have a caption below it. The captions should be indicated in the margin axes of figures must be labeled properly. The drawings for the figures must be copied by scanner and inserted in suitable location after the paragraph that refers to the figure directly. The figures should be identified by the name and figure number.

**Tables:**

Tables should be inserted in a suitable location after the paragraph that refers to the table directly and each table should have a number and headed by a title.

**References:**

References to other works should be consecutively numbered in which they are cited in the text identified by Arabic numerals in big parentheses [ ], and should be listed by number on a separate sheet at the end of the paper. Examples of correct reference forms are given below.

**An article/ paper in a Journal / Perioidal / Serial**

S.A. Al-jibori, O.H. Amin, T.A.K. Al-Allaf, R.Davis.

**A Book**

W.R. Adams (1977) " Developing reading versatility" 2nd Ed. New York Holt, Rinehart and Winston.

**A Chapter in a Book**

K. Koerner (1994) Historiography of linguistics in the encyclopedia of languages and linguistics (Eds Asher Rand Simpson J) Oxford : Pergamon press Vol. 3,P.1572.

**A Thesis**

J.N. Edwards (1990) Ph.D. thesis, University of Bristol, U.K.

**A Patent**

Y. Funatsukuri (1996) (Sanyo Electric Co.) projection type colors liquid crystal device Japanese Patent JP 08.5, 1975.

<sup>3</sup> Department of Biology, College of Education, University of Tikrit, Tikrit, Iraq

### Abstract:

Four stations were selected for water sample collections, to study the effects of some water characteristics of Lower Zab tributary on the Tigris river, during the period from November 2001 to October 2002.

Air and water temperature were (10-38)<sup>o</sup>C and (10-28)<sup>o</sup>C respectively. Salinity values ranged (0.25-0.33)‰. Turbidity varied from (22) NTU at station 2 to (34.4) NTU at station 3. pH values ranged (7.5 - 8.6). Dissolved Oxygen values were higher in Lower Zab water compared to that of Tigris River. BOD were high at summer and low during winter.

Total hardness ,calcium and Alkalinity were (222-306) mg/L, (133-165) mg/L and (134-165) mg/L respectively. Nutrition values of the water samples were low, (0.4µg/L) for nitrite, (0.27µg/L) for phosphate, and (2.1

mg/L) for silica at station 4 after the confluence. While these values were higher at station 3 before the confluence (0.6µg/L), (0.4µg/L) and (2.9mg/L) respectively. Chloride ions values ranged (33.5-38.6) mg/L. Discussion of the results of this study clarify that Lower Zab effects the environment of the Tigris river at station 4 through the values of the turbidity, total hardness and negative ions which is located in the river after the confluence, in addition to the decrease of nutritive compared to station 3 in the river. This is certainly due to the favorable conditions at station 4, which cause blooming and diversity of aquatic organisms. This was obvious from the BOD<sub>5</sub> values at station 4. The high BOD<sub>5</sub> values was proportional to organic pollutants.

### Introduction:

Surface water in Iraq forms an area of (2400km<sup>2</sup>). This forms 5% of the total Iraqi lands, which is distributed in various water systems [1].

Hydrological characteristics of Iraqi lands affected by the two rivers, Tigris and Euphrates and their related branches [2]. Lower Zab tributary forms one of the major branches of Tigris River, with a length extends 400 km and over an area of (22250 km<sup>2</sup>) from its origin in Iran. This area is mainly located in Zakaros mountain in Iran. In Iraq, its length extends about 175km and above 200m wide [3]. Lower Zab consists of a gravel base with a mean water discharge of (233-245)m<sup>3</sup>/sec [4].

Water characteristics of Rafidain valley like many other water areas of the world is affected by the climate, nature, soil, inner water and its bioactivities. In addition, Tigris river limnology is generally affected by it's tributaries [2].

Many studies conducted on the Iraqi surface water, but were all concentrated on limited area [5, 6, 7, 8]. Therefore, the present study aims to know the effects of some physical and chemical factors of Lower Zab water on Tigris River water.

### Materials and Methods:

Four stations were selected in Tigris river (stations 3,4) and in the Lower Zab tributary (stations 1,2) (Figure -1). Monthly water samples were collected from November 2001 to October 2002.

Air and water temperatures were measured using mercury thermometer. A conductivity meter (YSI-33cc) was used to measure water conductivity (µ semins/ cm). Salinity was calculated using the following equation [9]:

$$\text{Salinity (gm/L)} = 0.00064 \times \text{conductivity.}$$

Turbidity (NTU) was measured using the turbidity meter (HACH-16800cc). Water pH was measured using a pH meter (pH-EC. TDC meter /HI-9811). Winkler method [10] was used to measure dissolved oxygen (mg/L) and Biochemical Oxygen Demand (BOD). The method described in [11] was used to measure alkalinity, total hardness and calcium ions. Chloride, Nitrate, active phosphate and Silica were measured using the methods in standard methods for the examination of water method for Sea water analysis [10, 12].

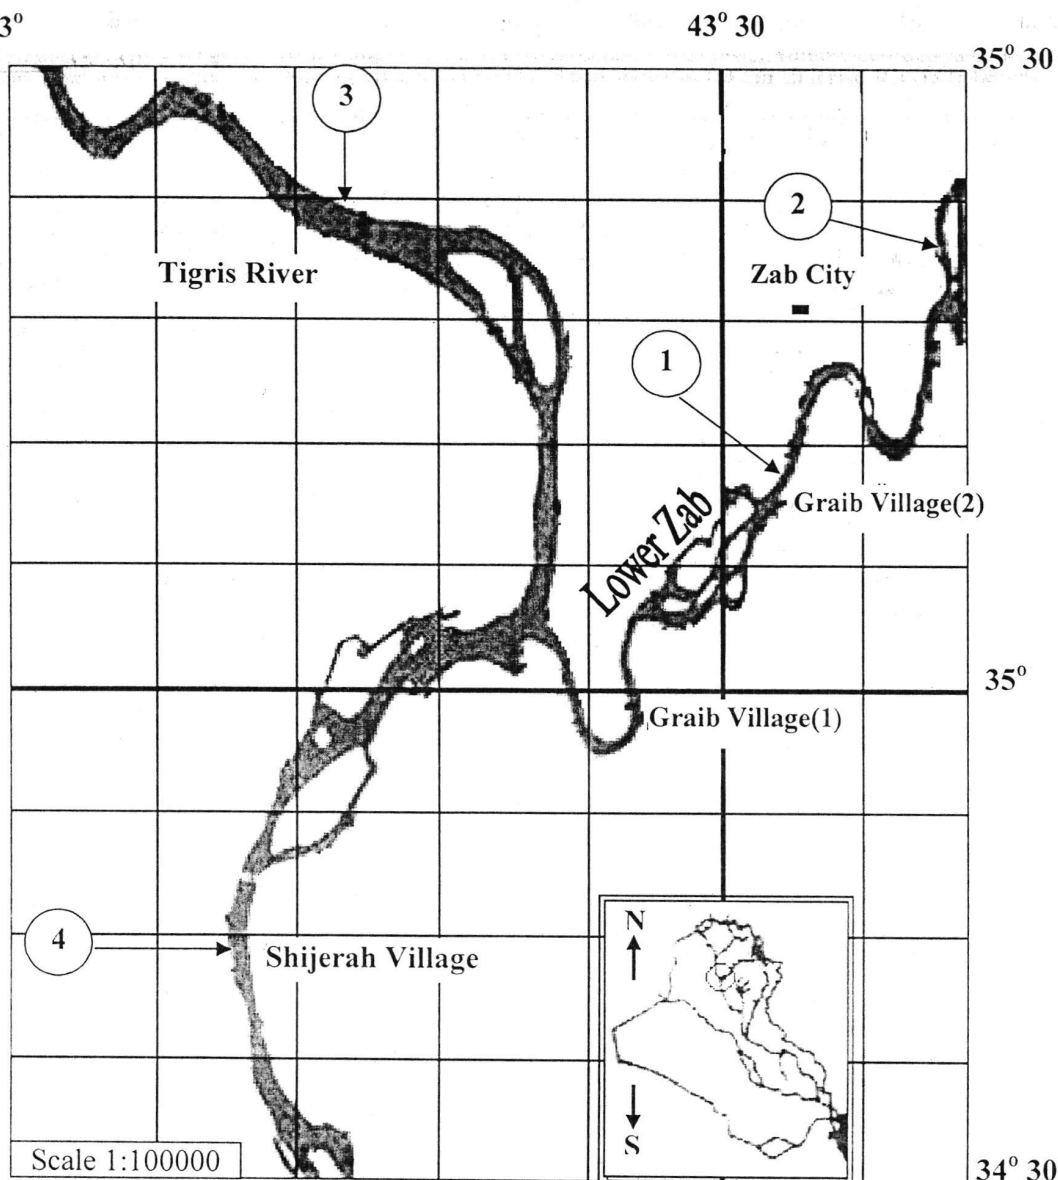

Fig. 1: Study Area; Lower Zab (stations 1, 2) & Tigris River (stations 3, 4)

**Results & Discussion:**

Air and water temperatures were close. In that, both air and water temperatures increased during summer and early autumn, and decreased in winter (Table-1; Figure 2). Salinity values varied at the different stations. Low values recorded at station 4 in Tigris river (0.25 gm/L), and the maximum values recorded in Lower Zab at station 2 (0.33 gm/L) (Table-1; Figure 3-a). Average turbidity values in Tigris River at station 4 and 3 were (26.5 NTU) and (34.4 NTU) respectively. While turbidity at stations 1 and 2 were in between the previous values (Table-1; Figure 3-b). Turbidity in the rivers are at the almost high during increase water level and high rapid flow, Which causes increase water suspended matter and mixing of water during rain periods(Hynes 1974) . In a study on Tigris River [2], turbidity values were related to the suspended solid substances, such as mud and silts which increased during the periods of rains and high discharge.

pH values in the present study inclined towards weak alkalinity (7.5-8.6) (Table-1; Figure 5-a). This coincides with results of previous studies [13, 14, 15], which pointed towards weak alkalinity of Iraqi water. Dissolved oxygen values did not fall below 5.2 mg/L. High values recorded in the Lower Zab compared to Tigris River (Table-1; Figure 4-a). This was related to the fast flow and good mixing [14, 15, 16]. Biochemical Oxygen Demand (BOD<sub>5</sub>) values were high during summer (Table-1; Figure 4-b). The real cause is the presence of organic biodegradable matter that are consumed by bacteria. Dissolved oxygen, also decreases with an increase in temperature [17]. Total hardness recorded high values at station 3 in Tigris River, compared with station 1 in Lower Zab (Table-1; Figure 6-a). AL- Lami [2] founded close values, and this was attributed as follows; Tigris river water is considered hard water, and the real causes of hardness is the nature of catchments area through which the Tigris river flows.

Also the polluted loads discharges add to this hardness. Low calcium ions values (133 mg/L) recorded at station 4 in Tigris River, and this could be due to the consumption of the ions by living organism bloomed at this station [3]. While, higher calcium ion values (165 mg/L) recorded at station 2 in Lower Zab. This is due to the surrounding soil nature (Table-1; Figure 6-b).

Table-1 and Figure 5-b, shows alkalinity values between 52 and 208 mg/L. These values were within the natural range [10]. Because most water alkalinities in Tigris River are due to bicarbonate ions. This was pointed out in many previous studies [8, 13].

Mean nitrite values recorded in the present study at all stations were close and low. A decreased value of nitrite below sensation level was recorded in station 3 in Tigris River (Table-1; Figure 7-b). Nitrite values in the unpolluted good ventilated waters are low [2]. This is true because of the values of dissolved oxygen at the same station (6.5- 9.7 mg/L).

Phosphate values at stations 3 and 4 were (0.4 µg/L) and (0.27 µg/L) respectively in Tigris River (Table-1; Figure 8-a). This is because of dilution effect after the confluence of Lower Zab into Tigris River. Also due to the consumption by living aquatic organisms. Plant nutritives considered to be very important in increasing primary productivity, which forms the principal base of food chain in aquatic environment [18].

The maximum silica value (5.7 mg/L) recorded at station 1 in Lower Zab, and the lower values recorded at station 4 in Tigris River (2.1 mg /L) (Table-1; Figure 8-b). Silica found naturally in water in concentrations ranged (1-10 mg/L). Silica concentration ranged (0.5-0.8) mg/L required for diatoms growth [19].

The upper chloride values recorded at all stations did not exceeded 200 mg/L ; the upper chloride ions concentration allowed and preferred in drinking water recommended by WHO (1971). And the mean values recorded in the present study were close to the preferable concentration of 25 mg/L of drinking water .The low chloride value recorded was 7.5 mg/L .This was lower than the values recorded by Saleh [20] and Al-Doori [21] in Tigris river /Salahudeen province . The upper chloride value was (38.6 mg/L) , this was also lower than the values recorded by the previous two authors .The mean chloride values were close to the preferable level (25 mg/L) allowed in the international characterization and the characterization of Iraqi waters No. 25 in 1967. Chlorides are among the important negative ions in natural waters and which give the water its salty test when it binds with sodium ions and change with concentration .One of the most special characters of Iraqi waters are the dominance of Ca, HCO<sub>3</sub>, Cl, SO<sub>4</sub> ions .This emphasize the mineral contents of the rocks in the river basin, which was also stated by Al-Lami and Al-Aubaidi [14].

Table 1: Range, Mean and standard deviations of the physical and chemical measurements for the surface water at the different stations during 2001-2002.

Factors	Station	Lower Zab		Tigris river	
		1	2	3	4
Air Temperature (°C)		12 - 36	12 -34	13.5-38	10-31
Water Temperature (°C)		11 - 27	10 - 27	10-28	10-24
Salinity (‰)		0.19 - 0.46 (0.31) ± 0.1	0.2 - 0.59 (0.33) ± 0.1	0.22-0.46 (0.28) ± 0.1	0.16-0.35 (0.25) ± 0.04
Turbidity (NTU)		0.73 -111 (27.1) ± 30	ND - 109 (22) = 30.7	0.24-185 (34.4) ± 54.8	2.57-72 (26.5) ± 23
pH		7.9 - 8.3 (8.12) ± 0.1	7.7 - 8.4 (8.1) ± 0.1	7.8-8.3 (8.1) ± 0.1	7.5-8.6 (8.1) ± 0.3

### الملخص:

للسليكا في المحطة الرابعة بعد مصب الراقد في نهر دجلة. بينما كانت قيم المغذيات أعلاه في المحطة الثالثة في نهر دجلة مرتفعة، حيث سجلت (0.6 مايكرو غرام / لتر) و(0.4 مايكرو غرام/ لتر) و(2.9 ملغم/لتر) على التوالي .

أما قيم الكلوريد فقد تراوحت (33.5-38.6) ملغم/ لتر. نوقشت النتائج على أساس التغيرات البيئية في مياه المحطات 1 و2 و3 و بالتالي تأثيرها على مياه المحطة الرابعة. وقد تبين من النتائج إن الزاب الأسفل يؤثر على بيئة نهر دجلة في المحطة الرابعة من خلال قيم العكورة، والعسرة الكلية والايونات السالبة والواقعة في نهر دجلة بعد نقطة اتصاله بالنهر، إضافة إلى انخفاض قيم المغذيات مقارنة بالمحطة الثالثة. وهذا بالتأكيد يعود إلى الظروف الملائمة في المحطة الرابعة والتي تسبب الازدهار والتنوع الحياتي للأحياء المائية. وهذا كان واضحاً من قيم المتطلب الحياتي للأوكسجين في المحطة الرابعة. القيم العالية للمتطلب الحياتي للأوكسجين كانت ذات علاقة بالتلوث العضوي الحاصل.

اختيرت أربعة محطات لجمع عينات مياه لدراسة تأثيرات بعض خصائص مياه رافد الزاب الأسفل على مياه نهر دجلة من تشرين الثاني 2001 ولغاية تشرين الأول 2002. تراوحت درجات حرارة الهواء والماء (10-38)° م و(10-28)° م على التوالي. في حين كانت قيم الملوحة بين (0.25-0.33) جزء بالآلف. كانت كدرة المياه(22 وحدة كدرة نفثالية) في المحطة 2 و(34.4 وحدة كدرة نفثالية) في المحطة 3. تراوحت درجة الأس الهيدروجيني في جميع المحطات بين(7.5-8.6) . قيم الأوكسجين المذاب كانت عالية في مياه الزاب الأسفل مقارنة بمياه نهر دجلة ، في حين كانت قيم المتطلب الحيوي للأوكسجين عالية خلال الصيف ومنخفضة خلال الشتاء . سجلت عسرة الكلية وايونات الكالسيوم والتقاعدية قيماً تراوحت بين (222-306)مغم/لتر، (133-165) ملغم/لتر و(134-165)ملغم/لتر على التوالي .

قيم المغذيات لعينات المياه كانت واضحة لحد ما، وبلغت (0.4مايكروغرام / لتر) للنترتيت و(0.27 مايكرو غرام/لتر) نيتروسفات و (2.1 ملغم/لتر)
